Equations of Lines and Planes 1

t is the parameter of the equation.

Reiterate: $\vec{r} = \vec{r_0} + ti\vec{P}$

Let
$$\vec{v} = \langle a, b, c \rangle$$

then $\langle x, y, z \rangle = \langle x_0, y_0, z_0 \rangle + t \langle a, b, c \rangle$

$$< x, y, z > = < x_0 + ta, y_0 + tb, z_0 + tc >$$

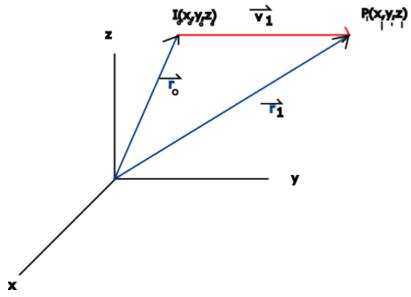

So the parametric equations for a line are as follows:

- $\bullet \ x = x_0 + ta$
- $\bullet \ \ y = y_0 + tb$
- $z = z_0 + tc$

When you solve for t, you get the symmetric equations.

$$t = \frac{x - x_0}{a} = \frac{y - y_0}{b} = \frac{z - z_0}{c}$$
If $b = 0$, then you get:
$$\frac{x - x_0}{a} = \frac{z - z_0}{c}, y = y_0$$

$$\frac{x-x_0}{a} = \frac{z-z_0}{c}, y = y_0$$

Planes can be parallel, intersecting, or skew.

incomplete do later

Ex. Find where line L intersects plane 5x - 2y + 4z = 18

$$L: x = -4t, \ y = 5+t, \ z = 2+3t$$

$$5(-4t) - 2(5+t) + 4(2+3t) = 18$$
 (1)

$$-20t - 10 - 2t + 8 + 12t = 18 \tag{2}$$

$$-10t = 20\tag{3}$$

$$t = -2 \tag{4}$$

.

- 1. Two planes are parallel if their normal vectors are parallel.
- 2. Two planes that are not parallel intersect along a line
- 3. The angle between intersecting planes is the angle between their normal vectors

Ex.: Consider planes x + y + z = 1 and 3x + y - 2z = 1

a) Find the angle between the planes

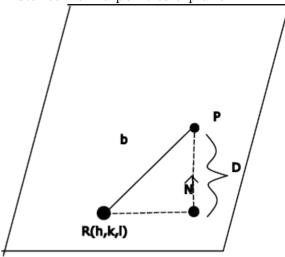

1.1 Continued

$$\vec{n_1} = <1, 1, 1>, \vec{n_2} = <3, 1, -2>$$
 (1)

$$\vec{n_1} \cdot \vec{n_2} = |\vec{n_1}| |\vec{n_2}| \cos \theta \tag{2}$$

Use the equations of two planes to describe a line

Distance from a point to a plane

 $P_1(x_1, y_1, z_1)$ ax + by + cz + d = 0

EX: Find the distance between the parallel planes

1.2 E

x: Find the distance between the lines L_1 and L_2

The distance between L_1 and L_2 is teh same as teh distance between the two parallel planes that contain these lines.

The normal vector \vec{n} for these two planes must be orthogonal to $\vec{v_1}$ and $\vec{v_2}$
